1. Executive Summary

Eocean (stylised e.ocean, legally Eocean (Private) Limited) is a Pakistan-based Communications Platform as a Service (CPaaS) company. Founded in 2008 and headquartered in Karachi, it builds and operates a cloud communication platform that lets businesses reach customers through SMS, WhatsApp, voice calls and Rich Communication Services (RCS), and manage those conversations from a single environment.

Its pitch to the market is simple: abstract away the technical and regulatory complexity of telecom connectivity so that a bank, a retailer, a utility or a logistics company can send an OTP, answer a customer on WhatsApp or trigger an automated voice call with a few lines of code, or with no code at all through a web dashboard.

Key facts at a glance

Item	Detail
Founded	2008, Karachi, Pakistan
Business model	CPaaS: messaging, voice and customer-engagement APIs and applications
Channels	SMS API, WhatsApp Business API, Voice API, RCS
Products	Digital Connect, Voxara, xNotify
Reported scale	2,000+ customers; 180+ countries reachable; billions of API requests per year; 99.9%+ uptime
Leadership	Syed Amir Jafri (CEO, co-founder); Syed Asif Jafri (co-founder, director); Syed Salman Raza (CTO)
Offices	Head office: DHA Phase 2 Extension, Karachi. Regional office: F-8 Markaz, Islamabad
Recognition	Best XaaS Solution, Global Connectivity Awards 2025 (Capacity Global, London)

Why this document exists

This profile gives a reader (a prospective customer, partner, integrator or analyst) a structured overview of who Eocean is, what it sells, how its APIs are used in practice, and what evidence exists for its reliability. Sections 7 and 8 are practical developer walkthroughs drawn from Eocean's own documentation for the WhatsApp Business API Postman collection and the Voice OTP (IVR) service.

Summary of strengths

- **Local depth, global reach.** Long-standing relationships with Pakistani banks, telecom-adjacent enterprises and consumer brands, combined with international messaging connectivity.
- **Omnichannel under one roof.** SMS, WhatsApp, voice and RCS are offered through one vendor and, through Digital Connect, one inbox.
- **Official WhatsApp ecosystem standing.** Eocean is reported to be an official WhatsApp Business partner within Meta's ecosystem, which matters for regulated sectors such as banking and healthcare.
- **Proven enterprise deployments.** Published case studies include a hospital network, a courier company, a power utility and a retail brand.

2. Company Overview

2.1 Origins and mission

Eocean was founded in 2008 by brothers Syed Amir Jafri and Syed Asif Jafri to close a gap they saw in business-to-business communication in Pakistan: enterprises needed dependable, programmable ways to message and call their customers, but connecting directly to telecom operators was slow, fragmented and technically demanding. Eocean positioned itself as the layer in between.

The company describes its mission as bridging the gap between businesses and customers in a communication-driven world by hiding the complexity of communication behind powerful, easy-to-use tools. In a 2025 interview with BR Research, CEO Syed Amir Jafri said the company's guiding aim is to make enterprise communication dramatically simpler, and argued that digital services should be treated as national infrastructure rather than a luxury.

2.2 Milestones

Year	Milestone
2008	Eocean founded in Karachi as a two-person start-up
2011	Partnered with Summit Bank to launch SMS-based customer engagement services
2013	Obtained a Class Value Added Service (CVAS) licence from the Pakistan Telecommunication Authority
2015	Soneri Bank begins using Eocean as its messaging provider for banking alerts and OTPs
2021	Became an official WhatsApp Business partner in the Meta ecosystem
2025	Won Best Anything-as-a-Service (XaaS) Solution at the Global Connectivity Awards 2025; xNotify featured by Forbes
2026	xNotify launched on the Shopify App Store, bringing order notifications to e-commerce merchants

2.3 Leadership

Name	Role
Syed Amir Jafri	Chief Executive Officer and co-founder; also co-founder of the fintech Kistpay
Syed Asif Jafri	Co-founder and Director
Syed Salman Raza	Chief Technology Officer
Altaf Siddiqui	Director of Pre-Sales and Products

2.4 Footprint and scale

Eocean's own site highlights four headline metrics: loyal customers, annual API requests, API uptime and countries covered. Third-party profiles put these at more than 2,000 customers, more than two billion API requests a year, 99.97% uptime and reach into 180+ countries. Its client list spans global names such as Google, Facebook, Unilever, the British Council and Visa, alongside Pakistani leaders including Careem, Foodpanda, HBL and Soneri Bank.

2.5 Locations

- Head office: 29C Mezzanine Floor, Sunset Lane 1, Phase 2 Extension, DHA, Karachi, Pakistan
- Regional office: Office 10, Third Floor, Al Baber Center, F-8 Markaz, Islamabad, Pakistan
- Operating globally through international messaging and voice connectivity

3. Market Context: Why CPaaS Matters

3.1 What is CPaaS?

A Communications Platform as a Service lets organisations embed messaging, voice and video into their own applications and processes through APIs, without building or owning telecom infrastructure. Rather than negotiating with dozens of carriers, a business connects to one platform that handles routing, delivery reports, number management and compliance.

3.2 Drivers of demand

- **Application-to-person (A2P) messaging.** Banks, retailers and service companies send huge volumes of automated messages: OTPs, payment alerts, delivery updates and reminders.
- **Shift to conversational channels.** Customers increasingly prefer to ask questions on WhatsApp rather than wait on a phone line, pushing companies to offer rich, two-way chat.
- **Authentication and fraud prevention.** One-time passwords and two-factor authentication over SMS, voice and WhatsApp have become standard for logins and payments.
- **Automation and AI.** Chatbots, intelligent routing and personalised campaigns are layered on top of the same messaging pipes.
- **Digital infrastructure policy.** Pakistan's push toward digital banking, e-commerce and e-government raises the baseline expectation for reliable customer messaging.

3.3 Where Eocean fits

Eocean sits in the middle of this value chain. On one side it connects to mobile operators and messaging platforms; on the other it exposes REST-style APIs, web portals and ready-made applications to enterprises. Its value to customers comes from local regulatory knowledge (for example, its PTA CVAS licence), enterprise-grade support, and the ability to cover SMS, WhatsApp and voice in one contract.

4. Communication Channels

Eocean organises its services around four channels. Each can be consumed directly through APIs or through the Digital Connect inbox and campaign tools.

4.1 SMS API

SMS remains the most universal channel because it requires no app and works on every handset. Eocean's SMS API supports both transactional traffic (OTPs, banking alerts, order confirmations) and promotional campaigns, with delivery reporting and enterprise-grade throughput. Long-term customers such as Soneri Bank, Bykea, Bookme and Careem cite the API's reliability and support responsiveness in their testimonials.

Typical uses

- Banking alerts, billing notifications and statement reminders

- OTP delivery for logins, payments and ride or delivery apps
- Stock-delivery and order-status alerts (as used by Unilever Pakistan)
- Branded SMS and bulk promotional campaigns via a campaign manager

4.2 WhatsApp Business API

Because WhatsApp is the most widely used messaging app in many markets, the WhatsApp Business API is Eocean's most visible growth area. It allows companies to run verified business profiles, send template notifications, hold two-way conversations, share rich media such as images, PDFs and buttons, and hand over from a chatbot to a human agent.

Capabilities highlighted by Eocean

- Abandoned-cart recovery, real-time order updates and repeat-purchase reminders
- AI-powered chatbot assistance and call deflection from voice lines to WhatsApp
- Smooth live-agent handovers and proactive reminders
- Direct API integration or an end-to-end engagement suite

Section 7 walks through Eocean's Postman collection for the WhatsApp Business API client, and Section 9 summarises several large WhatsApp deployments.

4.3 Voice API

Eocean's Voice API provides programmable voice: outbound calls, interactive voice response (IVR) menus, click-to-call, call recording and analytics. It is used for appointment confirmations, collection reminders, service updates and, notably, voice OTP delivery for users who cannot or prefer not to receive an SMS. Section 8 documents the Voice OTP IVR service in detail.

4.4 RCS

Rich Communication Services upgrade the native Android messaging app with branded sender identity, images, carousels and buttons. Eocean offers RCS as a more engaging alternative to plain SMS for marketing and service messages, particularly where brand recognition and interactivity matter.

4.5 Channel comparison

Channel	Best for	Strengths	Considerations
SMS	OTPs, alerts, reminders	Universal reach; no app needed	Plain text; limited interactivity
WhatsApp	Conversations, support, commerce	Rich media, two-way chat, high engagement	Template approval and opt-in rules
Voice / IVR	Urgent alerts, OTP by call	Works on any phone; accessible	Higher cost per interaction
RCS	Branded rich campaigns	Carousels, buttons, verified sender	Needs compatible devices and carrier support

5. Products and Platforms

Beyond raw APIs, Eocean offers three named products that package its channels into ready-to-use applications.

5.1 Digital Connect

Digital Connect is Eocean's all-in-one customer engagement platform. It brings SMS, WhatsApp, voice and other channels into a single inbox so that support and sales teams can manage conversations without switching tools. Customers log in through the Digital Connect portal.

What it provides

- A unified inbox for multi-channel conversations
- Campaign management for promotional and transactional messaging
- Personalised campaign automation and rich messaging
- Chat and call-centre integrations, with chatbot and live-agent handover

5.2 Voxara

Voxara is Eocean's voice-focused solution, positioned around reliable voice with IVR, click-to-call, call recording and real-time analytics. It suits contact centres and businesses that need to automate inbound or outbound calling without building a telephony stack.

5.3 xNotify

xNotify is described as a smarter way to send notifications across every channel. It uses real-time machine learning and AI-defined attributes to help decide how and when to reach each customer, and was featured by Forbes. It has been adopted by the streaming platform Myco.io to deliver real-time alerts to millions of users.

xNotify on Shopify

In 2026 Eocean released xNotify on the Shopify App Store. It connects a store to a notification engine that sends order updates automatically when an order is created, shipped, delivered or cancelled.

- Channels: WhatsApp, SMS, email and push notifications, with smart fallback between them
- Event-to-template mapping, with content personalised using order data
- Delivery tracking showing sent, delivered and read status from a single dashboard
- Listed as free on the Shopify App Store at the time of writing

5.4 Product summary

Product	Primary purpose	Channels	Typical user
Digital Connect	Unified customer-engagement inbox and campaigns	SMS, WhatsApp, voice, more	Support, marketing and sales teams
Voxara	Voice, IVR and click-to-call	Voice	Contact centres, operations
xNotify	Intelligent multi-channel notifications	WhatsApp, SMS, email, push	E-commerce, apps, media

6. Solutions by Business Need

Eocean's website groups its offering into three solution families. Each bundles several channels and features around a business outcome.

6.1 Customer engagement

For brands that want to connect, inform and engage customers across channels. The family includes SMS campaigns, the WhatsApp Business API, rich messaging with images, PDFs and buttons, promotional and transactional messaging, a campaign manager, and personalised campaign automation.

6.2 Real-time communication

For two-way interactions that improve support, service and responsiveness. It includes programmable voice calls, click-to-call, two-way messaging, a campaign portal, chat and call-centre integrations, and real-time notifications.

6.3 Security and identity

For organisations that must verify and protect users at scale. It includes OTP over SMS, voice and WhatsApp, two-factor authentication, number masking, secure verification APIs, and consent and compliance frameworks.

6.4 Industry examples

Sector	Common use cases
Banking and fintech	OTPs, transaction alerts, WhatsApp Banking, collections reminders
Healthcare	Appointment booking, lab-result delivery, patient reminders
Logistics	Shipment tracking, rate enquiries, delivery notifications
Utilities	Bill access, complaint lodging, outage and schedule updates
Retail and e-commerce	Order status, product search, cart recovery, support chat
Ride-hailing and delivery	Driver and rider verification, trip alerts, number masking
Media and streaming	Real-time audience notifications and personalised alerts

7. Developer Guide: WhatsApp Business API Client Collection

Eocean publishes a Postman collection that lets developers explore the WhatsApp Business API client quickly. This section condenses that guide.

7.1 Prerequisites

- **Install Postman** on your computer.
- **Download the WhatsApp Business API collection** from the GitHub link provided in Eocean's documentation and import the files into Postman.
- **Select the 'WABiz Developer' environment** from the environment dropdown at the top right of Postman.

7.2 Configuration

The pre-configured WABiz Developer environment contains variables used throughout the collection. Open the environment editor (the eye icon next to the dropdown) and replace the defaults with your own values.

- Set the base URL variable to the web-app endpoint. This endpoint is provided by Eocean on request, and every request in the collection references it.
- Update credential and token variables as you go; for example, the token returned by the Login API must be saved into the corresponding variable so later calls can authenticate.

7.3 SSL settings

All WhatsApp Business API calls require HTTPS. In test environments with self-signed certificates, Postman may fail the certificate handshake. Developers can turn off SSL certificate verification under Settings, General. This is especially relevant on macOS 10.15 (Catalina) because of how the operating system manages certificates. Disable verification only for testing.

7.4 Calling the APIs

Login-Admin API

Login-Admin is the first and most important call. It returns an authorisation token (the AUTH token) that must be placed in the header of every other request. There are two ways to call it.

Approach 1: first-time setup

If this is the first run of your instance, you must change the root password and register. In the environment, set AdminUsername, AdminPassword and NewAdminPassword. The initial credentials are the factory defaults supplied by Eocean; NewAdminPassword is whatever you choose. In Postman, set Authorization to Basic Auth using those variables, put the new password in the request body as new_password, and send.

Approach 2: Base64 header

Alternatively, pass credentials in the Authorization header in Base64 form:

```
Authorization: Basic base64(username:password)
```

Standard login and responses

After the password has been changed, normal logins use the standard login request. The WhatsApp Business API client validates the credentials and responds as follows.

Outcome	HTTP status	Meaning
Success	200 OK	Returns the token and its expiry. Tokens expire after 7 days.
Failure	401 Unauthorized	Username or password invalid, so no token was generated.

On success, copy the token value into the AdminAuthToken environment variable. You can then update AdminPassword to the new password.

Send-Text-Message API

With a token in place, any other API in the collection can be called. The collection is ordered to follow the official documentation. For Send-Text-Message, the recipient identifier (Recipient-WA-ID) is the WhatsApp number of the person receiving the message.

Security tip: Change factory-default credentials immediately, store tokens in environment variables rather than in shared collections, and refresh tokens before the 7-day expiry.

8. Developer Guide: Voice OTP via IVR

8.1 Overview

The Voice OTP service lets an application deliver a one-time password by automated phone call. IVR (Interactive Voice Response) uses pre-recorded prompts and menus and can collect keypad responses from the user. The API triggers an outbound IVR call to the user's number, which is useful for identity verification when SMS is unavailable or less trusted.

8.2 Prerequisites

- **Number:** the user's contact number, in the correct format.
- **Code:** a numeric value used by the system to generate the IVR call (the OTP to be read out).
- **Username:** the account name registered in the system for API access.
- **Password:** the registered password for that account.

8.3 How a call is made

The application (or a browser, for testing) calls the outbound endpoint with the four parameters. The service shown below is illustrative; the unique path segment is issued by Eocean per account.

```
https://ivr.eocean.us/*****/outbound.cgi?number=033XXXXXXX&code=1234&username=demo&password=****
```

If the supplied parameters are verified and the API returns a success code, the platform places the call to the user's number and plays the code. If any parameter fails verification, the failure is returned in the API response and no call is placed.

8.4 Verification flow

1. The client calls the API with username, password, number and code.
2. The API authenticates the user.
3. The system checks that the credentials are verified.
4. If verified, the IVR processing service starts.
5. The user receives the IVR call on the registered number.
6. If any parameter is not verified, the API response says so and no call is made.

8.5 Request parameters

#	Field	Type	Length	Required	Sample
1	username	String	5	Mandatory	Demo
2	password	String	5	Mandatory	xxxxxx
3	number	Numeric	15	Mandatory	03xxxxxxxxxx
4	code	Numeric	20	Mandatory	1234

8.6 Response parameters

#	Field	Type	Sample
1	Response Code	String	200
2	Response Description	String	ok

8.7 Error codes

Code	Description
400	Bad Request
Unauthorized (listed as “2” in the source text)	Authentication failure; confirm the exact numeric code (commonly 401) with Eocean

8.8 When no call is processed

- The user’s number is invalid, so the call disconnects.
- The user disconnects the call.
- The call drops because of a system error.
- The user does not enter a valid code (where keypad input is required).
- Authentication fails.

Implementation note: Because the sample URL carries the password as a query parameter, production integrations should call the endpoint server-side over HTTPS, never from client code, and should avoid logging full request URLs.

9. Customer Success Stories

Eocean publishes case studies and testimonials that illustrate how its channels perform in demanding environments.

9.1 Aga Khan University Hospital: patient care on WhatsApp

AKUH integrated the WhatsApp Business API so patients can book appointments and receive lab results through a smart, automated chat interface. According to Eocean, this reduced call-centre load and improved response times.

9.2 TCS: more than half of queries handled on WhatsApp

The courier company TCS uses Eocean’s WhatsApp solution for shipment tracking, rate enquiries and support. Eocean reports that over 55% of TCS customer queries are now handled directly through WhatsApp, easing pressure on voice lines.

9.3 K-Electric: 24/7 utility self-service

K-Electric introduced automated self-service over WhatsApp. Customers can view bills, lodge complaints, check load-shedding schedules and subscribe to e-billing from their phones, leading to shorter waits and higher satisfaction.

9.4 Naheed: product search and orders

Retailer Naheed enabled customers to chat with a live agent, check order status, raise complaints and place new orders inside WhatsApp, simplifying interactions across the shopping journey.

9.5 What customers say

Customer	Channel / product	Theme of feedback
Foodpanda	SMS API	Simple, cost-effective; prompt support; data protection
Bookme	SMS API	Streamlined communication; round-the-clock support
Careem	SMS API and engagement	Long relationship; adapts as operations scale
HBL	WhatsApp Business API	Secure, seamless WhatsApp Banking delivered quickly
Soneri Bank	SMS API (since 2015)	Speed, reliability and support for alerts and OTPs
Unilever Pakistan	SMS API, notifications	Automated order tracking and delivery alerts
CDC	WhatsApp Business API	Stronger customer engagement through WhatsApp
Bykea	SMS API	Dependable OTP delivery and support
Myco.io	xNotify	Real-time notifications for a global streaming audience

Testimonials are published by Eocean and reflect each customer's own perspective; they have not been independently verified for this profile.

10. Security, Reliability and Compliance

10.1 Security posture

Messaging platforms handle sensitive data: phone numbers, OTPs, account alerts and personal conversations. Customers repeatedly highlight data protection as a differentiator for Eocean. Public profiles report that the company holds ISO 27001 certification for information security management, and its website carries a certificates section displaying its accreditations.

10.2 Reliability

Eocean reports 99.97% API uptime and the processing of more than two billion API requests annually. For an OTP or banking alert, availability is a business-critical property; multi-year relationships such as that with Soneri Bank (since 2015) suggest consistent performance in regulated settings.

10.3 Regulatory standing

- **PTA CVAS licence:** Eocean obtained a Class Value Added Service licence from the Pakistan Telecommunication Authority in 2013, which supports lawful operation of messaging and voice services in Pakistan.
- **WhatsApp Business partner:** official partner status within Meta's ecosystem, relevant for template approval, verified profiles and policy compliance.
- **Consent and compliance frameworks:** listed as part of the Security and Identity solution family.

10.4 Security features in the product set

- Two-factor authentication and OTP over SMS, voice and WhatsApp

- Number masking to protect the phone numbers of drivers, riders, agents and customers
- Secure verification APIs with token-based authentication (tokens that expire after seven days in the WhatsApp client)
- Role-based access to customer portals such as Digital Connect

10.5 Questions to ask during due diligence

- Request the current ISO certificate and its scope
- Ask for the uptime SLA, incident history and support response times
- Review message-template approval and opt-in handling for WhatsApp
- Agree escalation contacts for critical events such as OTP delays

11. Partnerships, Awards and Recognition

11.1 Technology partnerships

Eocean's website displays partnerships with major ecosystem players, including Meta (WhatsApp), Google Workspace and Amazon Web Services. These support messaging access, productivity integration and cloud infrastructure respectively.

11.2 Awards and press

- **Global Connectivity Awards 2025:** Eocean won Best Anything-as-a-Service (XaaS) Solution at the awards run by Capacity Global in London, competing against 418 companies from 45 countries.
- **Forbes:** featured xNotify for its use of real-time machine learning and AI-defined attributes to personalise engagement.
- **Industry interviews:** CEO Syed Amir Jafri was interviewed by BR Research in May 2025 on growth strategy and the role of AI, cloud and conversational commerce.

11.3 Partner programmes

According to a vendor listing on Elioplus, Eocean offers several ways to partner. Terms may have changed, so interested parties should confirm current details with sales.

Programme	Reported structure
Reseller	Recurring commission of roughly 20–30% for as long as the referred customer remains active
White label	Platform branded as the partner's own, from about US\$30,000 per year with around 50% recurring commission
White label with IP rights	Enterprise arrangement with code and intellectual-property rights; custom pricing

11.4 Market specialisation

The same listing places Eocean in the categories of marketing automation, sales process management and chatbots, serving small-office and home-office users, small and mid-sized businesses, and large enterprises.

12. Competitive Landscape

Eocean competes in a global CPaaS and A2P messaging market. Company-comparison pages from CB Insights place it alongside several international peers.

Company	Base	Founded	Focus
Eocean	Karachi, Pakistan	2008	Omnichannel SMS, WhatsApp, voice; local enterprise depth
Mitto	Zug, Switzerland	2013	Omnichannel messaging for telecom and customer engagement
Link Mobility	Oslo, Norway	2001	CPaaS, messaging and RCS for marketing, finance, logistics
Zenvia	São Paulo, Brazil	2004	AI-driven customer-experience automation
BSG	International	n/a	AI voice assistants, bulk SMS, Viber, RCS

12.1 Eocean's differentiators

- **Home-market expertise.** Years of work with Pakistani banks and enterprises, plus local licensing, give it an edge over foreign providers in a market with specific regulatory demands.
- **Single vendor for several channels.** Combining SMS, WhatsApp, voice and RCS reduces integration effort and contract overhead.
- **Responsive support.** Customers consistently praise availability and speed of support, a factor often decisive in A2P messaging.
- **Productised tools.** Digital Connect, Voxara and xNotify let non-developers launch campaigns and workflows.

12.2 Considerations

- As with any CPaaS, delivery quality depends on operator routes in each destination country; test critical corridors before committing.
- Public pricing detail is limited on third-party sites; consult the official pricing page and request a quote.

13. Getting Started with Eocean

13.1 Typical onboarding journey

1. Contact the sales team through the Request a Demo form or by email, and describe the use case (for example OTPs, WhatsApp support, or campaigns).
2. Shortlist channels and volumes, and receive a quotation. Review the pricing page for plan structures.
3. Complete account and compliance steps: business verification, sender ID registration, and WhatsApp business profile and template approval where relevant.
4. Receive credentials and endpoints; for the WhatsApp client or IVR service, Eocean issues the base URL and account-specific paths.
5. Integrate and test using the documentation, the Postman collection and a sandbox or test numbers.

6. Go live, monitor delivery reports, and tune templates, routes and fallbacks.

13.2 Integration options

Option	Who it suits	Effort
REST APIs	Engineering teams embedding messaging into apps	Medium; documented endpoints
Digital Connect portal	Marketing and support teams	Low; web-based, no code
xNotify for Shopify	Online merchants	Low; app-store install
Custom enterprise project	Banks and large enterprises	Higher; project-managed

13.3 Best practices

- Use SMS or WhatsApp as the primary OTP route and voice as the fallback.
- Keep message templates short, personalised and compliant with opt-in rules.
- Monitor delivery, read and failure rates, and set alerts for sudden drops.

13.4 Resources

Documentation: eocean.net/documentation. Help Centre: help.eocean.net. Pricing: eocean.net/pricing. Case studies and blogs: eocean.net/all-case-studies-listing and eocean.net/blogs.

14. Contact Information

Channel	Details
Email	sales@eocean.net
Phone	+92 (21) 37188880
Website	www.eocean.net
Head office	29C Mezzanine Floor, Sunset Lane 1, Phase 2 Extension, DHA, Karachi
Regional office	Office 10, Third Floor, Al Baber Center, F-8 Markaz, Islamabad
Social media	LinkedIn (EoceanEM), X (@eocean_net), Facebook (EoceanEM), Instagram (@eocean_global), YouTube

Eocean states that its team typically responds to enquiries within one business day.

Appendix A: Glossary and Source Notes

A.1 Glossary

Term	Meaning
A2P	Application-to-person messaging: automated messages sent by software to people
API	Application Programming Interface; a way for software to request services from another system
CPaaS	Communications Platform as a Service

Term	Meaning
CVAS	Class Value Added Service licence issued by Pakistan's telecom regulator
IVR	Interactive Voice Response: automated phone menus and prompts
OTP	One-time password used to verify identity or authorise a transaction

A.2 Source notes and limitations

- Company description, products, case studies and testimonials: Eocean's public website (eocean.net).
- Developer sections: Eocean's published WhatsApp Business API client Postman guide and Voice OTP (IVR) service documentation.
- Leadership, timeline and certification claims: third-party profiles (Craft, CB Insights, BR Research interview summary, and a press-profile page).
- Partner programme terms: Elioplus vendor listing; may be outdated.

This profile is an informational summary, not an offer, quotation or endorsement. Confirm pricing, certifications, service levels and legal terms directly with Eocean before relying on them.
